Introduction

MenuInfo is a low-level Windows function that was used in old Windows operating systems to add items to Windows Explorer right-click (context) menu. Because MenuInfo structure is used to add items to Explorer context menu only for Windows 95 / Windows 98 (not on XP, Vista, x64 - 64-bit Windows), to add items to Windows Explorer context menu you should use, according to Microsoft guidelines, appropriate .Net component - Windows Explorer Context Menu. This component is created for all .Net developers - for everyone who use C#, VB.NET and any other CLR language and will add items of all types to Windows Explorer context menu.

More info about MenuInfo

MenuInfo lists an application's current menu structure in a hierarchical format. The list includes submenu handles/menu item Ids, each item's position within it's parent menu, each item's text including it's mnemonic and any access keys associated with the items. An array of pertinent properties for each listed menu item can be selectively displayed. The list can also be saved to file.

MenuInfo will not retrieve an application's Command bar information.
